22nd April 2013

Breakdown

"There are weeks when decades happen"

- Title of Goldman Sachs Commodities Update, 16th April 2013.

Human beings are essentially pattern-recognition engines. We are hard-wired to recognise patterns, shapes and trends. Evolutionarily, this presumably yielded our ancestors benefits in the form of helping them to anticipate shifts in weather and the seasons, or to identify potential predators or sources of food. Human beings also have a longstanding appreciation of stories. So when we encounter moments of high drama, both of these evolutionary characteristics come to the fore: we associate the drama with the potential for crisis or threat; and we immediately start on a search for meaning. Who did it, and why ? Turning the drama into an engaging narrative may even be more satisfying to the human brain than striving for objective truth. Who cares if the story is nonsensical, illogical, or just plain wrong, as long as it's sufficiently enjoyable ? So when the gold price, in US dollars, fell by over 13% in the space of just two trading sessions a week ago, it was a natural reaction to start looking for significance (and to try and identify the protagonists). It was also a cue for legions of the misinformed, underinformed or chronically uninformed to start filling column inches with mindless drivel about what, if anything, it portended.

It helps the narrative when the instrument in question is so widely misunderstood. There are at least two wholly distinct participants in the market for gold. There are momentum-followers, who like to buy into rallies and sell into dips. These are speculators in paper gold, for want of a better turn of phrase. And there are those like us, tasked with the preservation of clients' capital in real terms, who favour gold as a form of sound money in the midst of a fraudulent global monetary landscape, in which inflationism is not just the norm but now explicit state policy. There are, indeed, other types of participant beyond these. There are also entities (states, and their economic agents) who have a vested interest in suppressing the gold price on the grounds that an elevated price for gold denotes a growing suspicion at the inherent soundness of fiat currency. Suffice to say that for us, the fact that the supply of gold cannot be suddenly or arbitrarily expanded simply by political whim is its defining characteristic, and one that trumps its perceived value as expressed in units of baseless fiat money.

So, to accelerate to the point. We had no target price (in US dollars, say) for gold before last week's antics in the futures market. We have no target price today. We will continue to hold gold, and for that matter silver, for as long as there is risk of acute monetary disorder in the global financial system. And we don't hold gold in isolation: we also invest into high quality credit

instruments, high quality equity investments, and uncorrelated funds. The beauty of this diversified approach is that because each asset class is distinct and discrete, it is comparatively rare for all four to move lock-step with each other. If all tended to move in the same direction at the same time, there would be no benefit from diversification. It is, indeed, plausible to presume that while we were incurring some mark-to-market pain in our bullion and bullion mining holdings, our trend-following managers were simultaneously making hay. It's an ill wind..

So some mysterious heavy selling in gold futures is unlikely to shift our prevailing philosophy or process much, if at all. If the politicians of the western world were suddenly to get religion and start pursuing balanced budgets, or if the central bankers of the western world were suddenly to abandon money printing, that might change things.

Beyond that, we would simply like to republish commentary we issued in November 2011, which we still think is absolutely relevant to the environment today.

Spoiler warning

"I am certain that my fellow Americans expect that on my induction into the Presidency I will address them with a candour and a decision which the present situation of our people impel. This is pre-eminently the time to speak the truth, the whole truth, frankly and boldly. Nor need we shrink from honestly facing conditions in our country today.. So, first of all, let me assert my firm belief that the only thing we have to fear is fear itself – nameless, unreasoning, unjustified terror which paralyzes needed efforts to convert retreat into advance.. In such a spirit on my part and on yours we face our common difficulties. They concern, thank God, only material things. Values have shrunken to fantastic levels; taxes have risen; our ability to pay has fallen; government of all kinds is faced by serious curtailment of income; the means of exchange are frozen in the currents of trade; the withered leaves of industrial enterprise lie on every side; farmers find no markets for their produce; the savings of many years in thousands of families are gone.."

- From President Franklin D. Roosevelt's Inaugural Address, March 4, 1933.

Just two years after 'The China Syndrome' lifted the lid on Spanish practices in the US nuclear industry, Jane Fonda and her production company, IPC Films, did a similar hatchet job on US banks with 1981's 'Rollover'. The Alan Pakula-directed film is certainly of its time (that is to say, paranoid and narrowly racist); environmental concerns have now segued into economic and financial malaise, with Arabs and their petrodollars as the enemy (if it could be remade today, and it probably couldn't, the Chinese and the Renminbi would doubtless be replacing them). Investors with strong stomachs – and these days, that needs to be all of us – can watch the devastating final minutes here, as the US / global financial system is brought to its knees.

We are often accused of being permabears, and it simply isn't true. We will, however, accept any charges of being brutal realists or pragmatists. What *is* true is that the financial world has been in a state of crisis for at least the past four years, and despite all the Sturm und Drang and the endless pontificating from the markets commentariat, the nature of the crisis is neither widely recognised nor widely understood. Greece, for example, is a sideshow. But it is symptomatic of the cause, which we identify as fundamentally a problem of debt.

As <u>Chris Martenson</u> has observed (and we note, in passing, how it takes non-financial professionals to see clearly through the fog of the present), perpetual expansion is a requirement of modern banking. The supply of credit at least doubled during the 70s, then again during the 80s, then again during the 90s, then again during the noughties. Martenson suggests, and we fully believe, that there is now simply more debt in the world than can ever be paid back. You can see it in pictorial form <u>here</u>. Note that that debt is concentrated in the western economies. So on the one hand, we have a requirement for perpetual economic expansion, if only in the cause of debt service. On the other hand, the western economies have run into the sand. A recent McKinsey report on debt plainly identifies the problem. After a forty year party of debt-fuelled growth, we have the hangover of deleveraging. Historic episodes of deleveraging fit into one of four archetypes:

I) austerity (or "belt-tightening"), in which credit growth lags behind GDP growth for many years;

- 2) massive defaults;
- 3) high inflation; or

4) growing out of debt through very rapid real GDP growth caused by a war effort, a "peace dividend" following war, or an oil boom.

McKinsey's words, not ours. So choose your poison – assuming you have a choice.

And therein lies the problem. The dead weight of debt was amassed in large part by politicians promising more than they could ever deliver, with taxpayers now and to be born involuntarily taking up the slack. And it was facilitated by banks, the scale of whose malinvestment excesses has effectively caused their finances to be fused with those of national governments. Whether the crisis is resolved via options 1, 2, 3 or 4 (or combinations thereof) will be a function of cultural stability and political will - it is certainly not precisely predictable. The UK, so far, under a fractious coalition government has opted for 1. The grisly farce that is Greece will probably plump for 2. Option 4 looks unrealistic but US militarism cannot be entirely discounted. Option 3 continues to look like the most politically expedient "solution" for most of the indebted world. The business of investing involves a probabilistic quest for certainty where none exists. Hence asset diversification. But we have established to our own satisfaction a few ground rules. G7 government debt looks like a 'safe haven' bubble that could end disastrously. But if G7 government bond yields really are sustainable at their current, pitifully low levels, that implies a Japanified prolonged deflation that is logically consistent with a disaster for most other traditional assets. So sensible and uncorrelated investments scream out as one solution - we vote for systematic trendfollowing funds, and are now examining insurance-linked and infrastructure investments. And one thing "seems" certain: ongoing currency debauchery in the west, which would make the case for the monetary metals even without the simultaneous, grave and tangible threat to our banking and financial infrastructure.

During the conclusion of 'Rollover', a tearful young Asian banker summarizes the *intra-day* damage to her dealing room head: stock market down 10%; the same for the dollar; rival firms essentially bankrupt; gold just breaking above \$2,000. His response: "By tonight, that'll be cheap." The economic logic is sound. We have been conditioned for the last forty years to price gold (for example) in an inconstant currency, the dollar. (Using the euro, the mongrel currency of a mongrel political union, would make the problem no more easily resolvable.) We make no apology for requoting Andreas Acavalos on the topic:

"..the problem of economic calculation under a fiat monetary regime is fundamentally insoluble. It cannot be solved for exactly the same reason that you cannot solve the problem of "measuring" a length of cloth with an elastic tape measure. The only "solution" is to throw away the elastic and use a yardstick that cannot be stretched at will."

That yardstick, of course, is gold. Mr Acavalos, again:

"Since it is unfortunately not within our power, as ordinary citizens, to do away with fiat money, we have to live with it and manage our affairs accordingly; we must, in other words, take rational economic decisions in the context of an irrational monetary regime that distorts relative prices and renders them increasingly meaningless as guides of where to invest. Here, I think, is where the role of gold comes in: acquiring gold is not an investment. It is a conscious decision to REFRAIN from investing until an honest monetary regime makes rational calculation of relative asset prices possible."

According to Wikipedia, the phrase "spoiler warning" started appearing during the early days of the internet so that unwitting readers didn't have vital plot points inadvertently revealed to them ahead of time. We apologise for giving away the plot to 'Rollover' – but as you'll find if you make the attempt, it's a difficult film to track down. I cannot recall its ever having been broadcast on terrestrial television here in the UK. Watch those final minutes and you can appreciate why. Films about meteorites, volcanoes, even earthquakes, the authorities can handle. Films about monetary and economic breakdown. Confidence and trust are inherently part of the modern financial system. Once broken and driven away, they will not easily return. With luck, the sort of panic that we see in the last minutes of 'Rollover,' as an institutionalized and local bank run becomes public and international, will not recur in our lifetimes. But the current pace of "progress" in the euro zone and for that matter global debt crisis might suggest otherwise. "By tonight that'll be cheap." Six words that should inspire fear in every politician and monetary policymaker, in Europe, the US and elsewhere.
